

About Your Water

Where Your Drinking Water Comes From

Most drinking water in the United States comes from a river, a lake, or from an underground well. The water we provide to you comes from Edwards Aquifer, which is groundwater, and is located in the City of Castroville.

We Protect the Source

Making the water safe to drink starts by protecting the place it comes from. We work with state scientists to take samples of water at its source to look for possible pollutants. This is called a Source Water Assessment.

What Is in Your Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which
 are by-products of industrial processes and petroleum production, and can also come
 from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, odor, or color of drinking water, please contact the system's business office.

You may be more vulnerable than the general population to certain microbial contaminants, such as Cryptosporidium, in drinking water. Infants, some elderly, or immunocompromised persons such as those undergoing chemotherapy for cancer; persons who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders, can be particularly at risk from infections. You should seek advice about drinking water from your physician or health care providers. Additional guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline (800-426-4791)

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but we cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Information about Source Water

TCEQ completed an assessment of your source water, and results indicate that some of our sources are susceptible to certain contaminants. The sampling requirements for your water system is based on this susceptibility and previous sample data. Any detections of these contaminants will be found in this Consumer Confidence Report. For more information on source water assessments and protection efforts at our system contact the **City of Castroville Public Works at 830-931-4090.**

Table of Water Data for 2022

This is your water quality report for January 1 to December 31, 2022 For more information regarding this report contact: Name John Gomez, 830-931-4090

TX1630033 Castroville Airport provides ground water from Edwards Aquifer located in Medina County.

Este reporte incluye información importante sobre el agua para tomar. Para asistencia en español, favor de llamar al telefono (930) 931-4090.

2022 Water Quality Test Results

Inorganic Contaminants	Collection Date	Highest Level Detected	Range of Individual Samples	MCLG	MCL	Units	Violation	Likely Source of Contamination
Fluoride	2022	0.17	0.17 – 0.17	4	4.0	ppm	N	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories.
Nitrate [measured as Nitrogen]	2022	2	2.1 – 2.1	10	10	ppm	N	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.

Disinfectant Residual

Disinfectant Residual	Year	Average Level	Range of Levels Detected	MRDL	MRDLG	Unit of Measure	Violation (Y/N)	Source in Drinking Water
Chlorine	01/01 – 03/31 2022	0.91	0.44 – 1.98	4	4	mg/L	N	Water additive used to control microbes.
Chlorine	04/01 – 06/30 2022	0.98	0.33 – 3.60	4	4	mg/L	N	Water additive used to control microbes.
Chlorine	07/01 – 09/30 2022	1.03	0.22 – 2.20	4	4	mg/L	N	Water additive used to control microbes.
Chlorine	10/01 – 12/31 2022	0.79	0.21 – 2.05	4	4	mg/L	N	Water additive used to control microbes.

Definitions and Abbreviations

The following tables contain scientific terms and measures, some of which may require explanation.

ACRONYMS	DEFINITIONS				
Action Level:	The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.				
Avg:	Regulatory compliance with some MCLs are based on running annual average of monthly samples.				
Level 1 Assessment:	A Level 1 assessment is a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.				
Level 2 Assessment:	A Level 2 assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an E. coli MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.				
Maximum Contaminant Level or	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the				
MCL:	MCLGs as feasible using the best available treatment technology.				
Maximum Contaminant Level	The level of a contaminant in drinking water below which there is no known or expected risk to				
Goal or MCLG:	health. MCLGs allow for a margin of safety.				
Maximum residual disinfectant	The highest level of a disinfectant allowed in drinking water. There is convincing evidence that				
level or MRDL:	addition of a disinfectant is necessary for control of microbial contaminants.				
Maximum residual disinfectant level goal or MRDLG:	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.				
MFL	million fibers per liter (a measure of asbestos)				
mrem:	millirems per year (a measure of radiation absorbed by the body)				
na:	not applicable.				
NTU	nephelometric turbidity units (a measure of turbidity)				
pCi/L	picocuries per liter (a measure of radioactivity)				
ppb:	micrograms per liter or parts per billion				
ppm:	milligrams per liter or parts per million				
ppq	parts per quadrillion, or picograms per liter (pg/L)				
ppt	parts per trillion, or nanograms per liter (ng/L)				
Treatment Technique or TT:	A required process intended to reduce the level of a contaminant in drinking water.
